**WHAT MAKES IT DIFFERENT**

Privacy you switch on

Public by default. A user can shield identity where it matters while the contract activity stays auditable. The chain calls this selective disclosure: private for people, transparent for the protocol.

PROOF SYSTEM**PLONK zero-knowledge****COMPATIBILITY****EVM · Ethereum contracts run unchanged****WHAT IT COSTS TO USE**

Fees you can predict

Transactions are paid in gasDAI, a unit pegged to the dollar. A transaction costs the same on a quiet day and a busy one. No volatile gas token to hold; gasDAI comes through the bridge.

GAS UNIT**gasDAI****OFFICIAL BRIDGE****Free · one to one · two to three hours****WHAT IS ALREADY RUNNING**

Rails, not roadmaps

RocketSwap for trading, Anubis Bridge and GaleBridge for moving in, an explorer by Blockscout, indexing by The Graph, cross-chain via LayerZero and Stargate. Wallets: Bitget, OKX, TokenPocket, Binance Wallet, MetaMask.
